Overview

We have created an easy to use JQuery multilevel animated menu for Sharepoint 2010. Useful for front end sites and intranets and fully customizable and dynamic.

We have developed a custom multilanguage feature.

This menu is adapted to all default Sharepoint CSS styles and it can be redesigned for custom purposes editing the attached CSS stylesheet

The main use is for the navigation menu useful for public sites (front-end) and it works for intranet as well.

Why Menu Web Part

We've noticed that Sharepoint out of the box menus (quicklaunch and main menu) has too many items and sometimes we want to make it easier. This means choosing the elements we want to display and make a hierarchy based on levels, hide some unuseful areas or items for advanced users. This menu allows us to choose manually which elements would be displayed using relative links in different languages and decide the name of the menu item.

This web part is oriented for internet sites (public front-end). In this case we have one public front end and we have to offer a simple navigation, a user friendly interface and the links necessary for the main public sitemap in different languages.

We have faced the problematic of the public sites, every time more often in SharePoint, where you have the possibility to select a language.

This web part is compatible with the other versions of Sharepoint 2010 but it has been designed to work (multilanguage) without variations: Instead, we use custom list of languages with standard ISO (language culture name) and also with all the advantages that variations offers. We also can create different elements with each language.

How to Use

Once you have installed it, you will see two different lists:

- **Language:** This list contains the languages supported by the menu. These are the elements of the form:

Language: Name of the language, you can add what you want (any name or language)

Culture: Code of the culture language, this column has to be one of the international codes. You can check it out at:

<http://msdn.microsoft.com/en-ES/library/ee825488%28v=cs.20%29.aspx>

A screenshot of a SharePoint list interface. On the left, there is a vertical toolbar with icons for 'Edit', 'Add', and 'Delete', and a link 'Agregar nuevo elemento'. The main area shows a table with two columns: 'Language' and 'Culture'. The 'Language' column contains 'Español', 'English', and 'Portuguese', each followed by a small green icon. The 'Culture' column contains 'es-ES', 'en-GB', and 'pt-PT'.

Language	Culture
Español	es-ES
English	en-GB
Portuguese	pt-PT

- **Menu:** List that contains the elements of the menu. The fields are:

Title: Title of the menu (The one you are going to display in the menu)

Level: Level of the menu, in this version there are two possible values 1 and 2. (section / subsection)

Position: Position that the element takes, it has to be an incremental numerical value. (The order from left to right of the items)

DestinationURL: Relative URL to the site of the page that links to this item when you click on it.

Example: If our web page is

<http://www.olympusconsulting.com/sitepages/inicio.aspx>. The value to enter in this field would be **sitepages/inicio.aspx**

Active: Field that indicates whether the element is active or not.

Language: language that belongs to this element, this column is a dropdown box from the list language.

ParentCategory: If the item is level 2 we have to add the parent element, if it's level 1, we will not fill this field.
