

## OneNet Configuration

A OneNet site is configured using an XML Site.config file with the following basic structure:

```
<site>
  <module>
    <type>
      <toleft>
        <control></control>
        ...
      <toleft>
      <topright>
        <control></control>
        ...
      <topright>
    </type>
  </module>
  ...
</site>
```

| Element | Role  |
|---------|---|
| Site    | Contains all the Modules defined for a Site                 |
| Module  | Groups related Types  |
| Type    | Defines the User Controls that make up a given type of page |
| Control | Specifies a User Control                                    |

## OneNet Page Grid

The OneNet page is divided into seven layout areas. Each area is an HTML div, grouped as shown below, with its position controlled by the site style sheet.

Within a Type configuration, each Control is placed within one of these layout areas. This placement determines the relative position and reading order of the Control.

|                            |                            |                              |  |
|----------------------------|----------------------------|------------------------------|--|
| TopLeftDiv (toleft)        |                            | TopRightDiv (topright)       |  |
| MainLeftDiv (mainleft)     | MainMiddleDiv (mainmiddle) | MainRightDiv (mainright)     |  |
| BottomLeftDiv (bottomleft) |                            | BottomRightDiv (bottomright) |  |
